## ARTICLE INFO

## ABSTRACT

This study explores the emerging field of artificial intelligence (AI) and how it can be used in the human resources (HR) industry. Knowing AI's function and implications is essential as more and more companies use it to improve HR procedures. This study uses a demographic analysis approach to investigate the various consequences of AI adoption in HR practices. The first section of the paper sets the scene for the growing importance of AI in HR by emphasizing how it may improve hiring, talent management, and employee engagement. The study examines how several demographic parameters, including age, gender, education level, and cultural background, affect employees' acceptance and integration of AI by using demographic data. The report also looks at the potential and problems that come with implementing AI in HR departments across a range of business contexts. In order to provide fair and equitable results in decision-making processes, it investigates potential biases present in AI algorithms as well as mitigation measures. Additionally, the study looks into how AI-driven analytics may be used to forecast labor trends and improve HR plans in response to changing business requirements. Organizations can customize AI solutions to address certain labor characteristics and improve overall operational efficiency by utilizing demographic analytics. In the end, this study adds real data and insights from demographic research to the expanding conversation on the nexus between AI and HR. It emphasizes how crucial it is to take demographics into account while developing AI-powered HR systems and promotes a well-rounded strategy that gives inclusion and ethical issues top priority.

**Keywords:** Artificial Intelligence; Human Resources; Demographic Analysis; HR Practices; Technology Integration.

## INTRODUCTION

A critical area of research and innovation in today's world of quickly changing technology and shifting labor demographics is the use of Artificial Intelligence (AI) into Human Resources (HR) operations. AI offers unparalleled potential to transform many aspects of HR administration because of its capacity to mimic human intellect in tasks that have hitherto required human intervention. This introduction lays the groundwork for a thorough examination of the implications, difficulties, and possibilities of AI in HR as seen through the lens of demographic analysis (Dzwigol, 2020).

It is impossible to overestimate the importance of AI in HR, as businesses all over the world are attempting to take advantage of its powers to improve decision-making, expedite operations, and maximize employee experiences. HR professionals now have the tools to manage the complexities of talent acquisition, retention, and development more effectively and efficiently than ever before thanks to AI-driven technologies like machine learning, natural language processing, and predictive analytics (Froehlich *et al.*, 2020).

An essential component of investigating AI in HR is acknowledging the demographic changes influencing modern workplaces. The age, gender, ethnicity, education level, and cultural background of a workforce all have a significant impact on the attitudes, behaviors, and makeup of the workforce. Therefore, it is critical to comprehend how these demographic factors relate to the adoption and application of AI in HR procedures in order to guarantee fair and inclusive results (Jordan *et al.*, 2020).

This study uses a demographic analysis methodology to examine the complex interactions between AI and HR. The study intends to clarify how various demographic groups view, interact with, and are affected by AI technologies in the HR area by examining demographic data. It also looks for possible differences in how AI is used by different demographic groups and finds ways to reduce prejudice and advance equity (Kuo *et al.*, 2020). The application of AI to hiring and personnel management procedures is one of the main research topics. Conventional hiring practices frequently contain ingrained prejudices that could unintentionally maintain differences in hiring results. By using data-driven algorithms to evaluate candidate qualifications, forecast job fit, and enable more objective decision-making, AI-powered solutions hold the promise of reducing bias. But worries about algorithmic transparency and fairness demand a more careful analysis of the ways in which demographics impact the development and application of AI recruitment tools (Lorenz *et al.*, 2020).

Moreover, further research is necessary to fully understand how AI promotes employee engagement and retention. Artificial Intelligence has the ability to improve worker satisfaction and productivity through sentiment analysis of employee input, individualized learning recommendations, and predictive modeling of turnover risk. However, differences in work-life balance, communication preferences, and employee preferences among demographic groups highlight how crucial it is to customize AI interventions to meet a range of requirements and preferences (Mason *et al.*, 2020).

This study also aims to investigate the workforce planning and strategic HR decision-making implications of AI-driven analytics. Organizations can proactively address workforce difficulties by anticipating future talent demands, identifying skill gaps, and developing targeted interventions by leveraging demographic data insights. However, the use of AI-powered analytics must be carefully considered due to ethical concerns about data privacy, consent, and algorithmic accountability (Maxwell, 2021).

### SIGNIFICANCE OF THE STUDY

There are important ramifications for academia and practice when investigating the function of artificial intelligence (AI) in human resources (HR) using a demographic analysis technique. This section highlights the study's potential contributions to the subject of HR management and describes the main reasons it is important (Mosko *et al.*, 2021).

Comprehending the intersection of AI and demographic issues is imperative in fostering diversity, equity, and inclusion in today's heterogeneous workplaces. This study aims to investigate the effects of AI technologies on various demographic groups in HR practices. The findings may reveal potential biases and disparities and facilitate the development of more inclusive HR strategies and solutions. AI has the ability to completely transform HR services like talent management and recruitment, which are essential tasks. This study can shed light on how AI technologies are used in recruiting across demographic groups, which can help with hiring practices optimization, candidate experiences, and the development of a more qualified and diverse workforce. With the use of predictive modeling, feedback analysis, and personalized learning, AI-driven technology can improve employee engagement and retention. Tailored approaches to talent development and retention tactics can be informed by an understanding of how demographic factors influence the effectiveness of AI interventions in increasing employee satisfaction and productivity. Data privacy, algorithmic fairness, and transparency are critical ethical issues to take into account as AI is further incorporated into HR procedures (Rahman, 2020).

Through the identification of ethical issues and the proposal of principles for guaranteeing the fair and responsible use of AI technologies in HR management, this study might add to the conversation around responsible AI adoption. Through the use of a demographic analysis approach, this study fills the knowledge gap between academic research and real-world HR management applications. It offers scientific data and practical insights that can help HR professionals, legislators, and organizational leaders make decisions on how best to use AI while taking workforce demographics into account. HR management is changing as a result of demographic trends including aging populations, generational transitions, and a more diverse workforce. This study can assist firms in anticipating and adjusting to future workforce trends by analyzing the intersections between AI and demographic aspects. This will help them maintain their competitiveness and agility in a constantly evolving environment (Yang, 2019).

### METHODOLOGY

**Primary Research:** The gathering of data for primary research, sometimes referred to as field research, entails the creation of new information. This can be done in a variety of ways, for as through interviews and surveys. Things like questionnaires and interviews may be used to gather this data. In competitive intelligence and market research, the phrase is frequently employed (Connor, 2020).

### 3.1.2 Secondary Research:

Unlike primary research, which gathers data from participants or experiments, secondary research, usually referred to as desk research, consists of summarizing, compiling, and/or synthesizing previous studies. Secondary research might originate from print publications, magazines, and other internal or external sources (Shell, 2021).

### 3.3 STATEMENT OF PROBLEM

Even if the connected world's advancements increase productivity and efficiency, they also pose significant psychological difficulties for the organization's human aspect, prompting consideration of the following: Will artificial intelligence (AI) support or replace human resources in organizations? (Szymkowiak *et al.*, 2020)

Workers on manufacturing plant shop floors have already been impacted by automation, and now middle and strategic level managers are facing challenges from artificial intelligence that interfere with their cognitive functions. AI is putting people in danger; chatbots and self-driving cars are replacing humans; Siri helps people remember their appointments. Most fields use artificial intelligence. The conundrum or query therefore becomes: How is AI affecting human resources? (Tashakkori *et al.*, 2020)

### 3.4 RESEARCH DESIGN

In this study, both descriptive and exploratory research designs were employed. The exploratory study design was employed to investigate novel data, insights, and understanding regarding the impact of artificial intelligence on the evolution of human resource management. Null and alternative hypothesis formulation was aided by the exploratory study methodology. Several statistical methods and instruments were employed in a descriptive research design to evaluate the hypothesis (Yousefi *et al.*, 2020).

### 3.5 SAMPLE DESIGN

A non-probability sampling technique was used for the final selection of the respondents (Dianna, 2015).

### 3.6 SELECTED POPULATION

700 information technology companies situated in Pune were selected as the population of this study (Buzko, 2016).

### 3.7 SAMPLING AREA

The employees and HR professionals of IT companies situated in Pune were the sampling elements of this study. An excel sheet was prepared consisting of the list of 700 IT companies with their email addresses, contact information, etc. This was the sampling frame of this study (Robert *et al.*, 2017).

### 3.8 SAMPLE SIZE

We selected 400 respondents using a convenience sampling technique from a list of 700 IT companies situated in Pune (Shweta, 2017).

## RESULTS AND INTERPRETATION

An examination of demographic data provides detailed insights into the application and effects of artificial intelligence (AI) in human resources (HR) in the results section. Results show that different demographic groups use AI differently, suggesting possible gaps and places where HR procedures may be strengthened. In order to improve inclusivity and equity, the study also identifies demographic aspects that influence attitudes, actions, and perceptions of AI technologies in HR. Moreover, the findings show trends in AI-driven hiring results, employee engagement levels, and talent management strategies, offering factual data to support decision-making procedures for maximizing AI integration in HR departments (Malathi *et al.*, 2017).

### DEMOGRAPHIC PROFILE

**Table 4.1 Statistics- Demographic Profile**

		Age	Gender	Marital Status	Qualification	Monthly Income (in Rs.)	Work Experience (in Years)
N	<b>Valid</b>	400	400	400	400	400	400
	<b>Missing</b>	0	0	0	0	0	0

From the Statistics-Demographic Profile table, it is clear that six demographic variables were analysed using a frequency test. A total of 400 respondents answered their opinions, with no missing data in the analysis.

**Fig 4.1: Age Group**

From the table and bar chart, it is clear that 20% of the respondents belong to the 25-to-35-year age group, 42.5% belong to the 36-to-45-year age group, 8.75% belong to the 46-to-55-year age group, 21.75% belong to the 56-to-65-year age group, and 7% belong to above 65 years. Therefore, it can be said that most of the respondents in the IT companies were young employees in the age group of 36 to 45 years (Anupam, 2017).

**Fig 4.2: Gender**

From the table and bar chart, it is clear that 32.5% of the respondents were female employees, whereas 67.5% of the respondents were male employees in the information technology organisation in Bangalore and Bengaluru. Therefore, most of the employees were male in the IT companies (Lorenzo *et al.*, 2017).

**Fig 4.3: Marital Status**

From the table and bar chart, it is clear that 23.75% of the respondents were divorced employees, 55% of the respondents were married, and 21.25% of the respondents were unmarried employees. Therefore, most of the employees were married in the IT companies (Severin, 2017).

Fig 4.4: Qualification

From the table and bar chart, it is clear that 4% of the respondents were graduates, 7.5% of the respondents were educated in other courses, and 88.5% of the respondents were post-graduate employees. Therefore, most of the employees were post-graduate employees in the IT companies (Stone *et al.*, 2013).

Fig 4.5: Monthly Income

According to the above table, 15% of respondents have a monthly income of Rs. 1,00,000, 17.5% of respondents have a monthly income between Rs 25,001/-to Rs 50,000/-, 45% of respondents have a monthly income between Rs 50,001/-to Rs 75,000/-, and 22.5% of respondents have a monthly income between Rs 75,001/- to Rs 1,00,000/-. therefore, most of the employees having monthly income between Rs 50000/- to Rs 75,000/-, in the IT companies (Pandey *et al.*, 2016).

Fig 4.6: Work Experience

From the table and bar chart, it is clear that 15% of respondents have 11 to 15 years of work experience, 47.5% of respondents have 5 to 10 years of work experience, 13.75% have more than 15 years of work experience, and 23.75% of respondents have less than 5 years of experience. Therefore, most of the employees have 5 to 10 years of work experience in IT companies (Jessica, 2019).

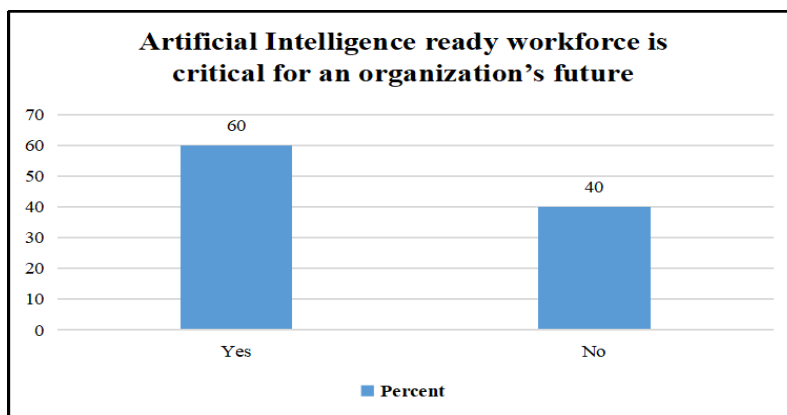

**GENERAL INFORMATION OF AI (ARTIFICIAL INTELLIGENCE)IN HR (HUMAN RESOURCE)**

**Table 4.8 Statistics- General Information of AI (Artificial Intelligence) in HR (Human Resource)**

	Artificial Intelligence plus human intelligence enhances the employee's experience.	Artificial Intelligence won't take away jobs but help employees do jobs better.	Artificial Intelligence ready workforce is critical for an organization's future.
Valid	400	400	400
Missing	0	0	0

From the Statistics-General Information of AI (Artificial Intelligence) in the HR (Human Resource) table, it is clear that three questions were analysed using a frequency test. All three questions were asked in the dichotomous scale, "yes or "no" format. There was no missing data in this section (Giebelhausen *et al.*, 2014).

**Table 4.11 Artificial Intelligence ready workforce is critical for an organization's future**

**Fig 4.6: Artificial Intelligence ready workforce is critical for an organization's future**

From the table and bar chart, it is clear that 40% of respondents said that an artificial intelligence (AI) ready workforce was not critical for an organization's future, whereas 60% of respondents said that an AI ready workforce was critical for an organization's future. Therefore, most of the respondents said that an AI ready workforce was critical for an organization's future (Brynjolfsson *et al.*, 2016).

**DISCUSSION**

This research article's discussion section explores the implications and importance of the findings from using a demographic analysis approach to examine the function of artificial intelligence (AI) in human resources (HR) (Pandey *et al.*, 2013).

First of all, the findings highlight how crucial it is to take demographics into account when developing and deploying AI-powered HR solutions. The use of AI varies throughout demographic groups, which draws attention to potential biases and inequities in HR procedures. Encouraging inclusive and fair workplaces requires addressing these discrepancies (NgIrene *et al.*, 2017).

The use of AI and its consequences for personnel management and recruitment procedures are also examined in this topic. Even if AI has the ability to expedite these procedures and enhance decision-making, issues with algorithmic bias and transparency need to be resolved to guarantee equitable results for all applicants (Chapman *et al.*, 2013).

Furthermore, the results clarify how AI might improve employee engagement and retention. Predictive analytics and personalized learning suggestions may be able to maximize worker happiness and output. The conversation does, however, highlight the necessity of customizing AI interventions to take into account the varied interests and work styles of employees (Fenech *et al.*, 2019).

The conversation also heavily touches on ethical issues pertaining to consent, algorithmic accountability, and data privacy. Organizations using AI responsibly must place a high priority on fairness and openness when utilizing these technologies, especially in delicate HR situations (Pandey *et al.*, 2015).

Lastly, the conversation emphasizes the research's wider ramifications for both practice and academia. Through its ability to connect the dots between AI and demographic analysis in HR, this study advances

knowledge in academia and informs real-world applications in HR management. In the future, research and cooperation will be crucial to maximizing AI's potential while maintaining equity, inclusivity, and moral application in HR procedures (Murgai, 2019).

## CONCLUSION

In summary, using a demographic analysis approach to examine the function of artificial intelligence (AI) in HR provides insightful information on the relationship between workforce diversity and technology. The significance of comprehending how AI technologies affect various demographic groups in HR practices from hiring and talent management to employee engagement and retention has been emphasized by this study. This research advances inclusive and equitable HR practices by addressing diversity and inclusion concerns, guiding the adoption of ethical AI, and anticipating future workforce trends. In the age of AI-driven HR management, it is critical that businesses use AI technology responsibly going forward, taking into account societal ramifications, ethical issues, and demographic trends to promote diverse, inclusive, and vibrant workplaces.
